Man is condemned to be free.

Jean-Paul Sartre

Idempotent generated semigroups

Many natural semigroups are idempotent-generated ($S = \langle E(S) \rangle$):

- The semigroup $\mathcal{T}_n \setminus \mathcal{S}_n$ of singular (non-invertible) transformations on a finite set (Howie, 1966);
- The singular part of $\mathcal{M}_n(\mathbb{F})$, the semigroup of all $n \times n$ matrices over a field $\mathbb{F}$ (Erdos (not Paul!), 1967);
- Classification of linear algebraic monoids that are idempotent-generated (Putcha, 2006);
- The singular part of $\mathcal{P}_n$, the singular part of the partition monoid on a finite set (East, FitzGerald, 2012);

Hence:

What can we say about the structure of the free-est idempotent-generated (IG) semigroup with a fixed structure/configuration of idempotents ???

Biordered sets of idempotents

'Configuration of idempotents' = biordered sets

Basic pair $\{e, f\}$ of idempotents:

$$\{e, f\} \cap \{ef, fe\} \neq \varnothing$$

(If e.g. $ef \in \{e, f\}$, then $(fe)^2 = fe$, and conversely.)

Biordered set of a semigroup S = the partial algebra on $E(S)$ obtained by retaining the products of basic pairs (in S).

Alternatively, biordered sets can be (abstractly) described as relational structures $(E(S), \leq^{(l)}, \leq^{(r)})$ with two quasi-orders and several simple rules/axioms (Easdown, Nambooripad, '80s).

Free IG semigroups: idea

- To every semigroup S with idempotents E associate the free-est semigroup $\mathsf{IG}(E)$ whose idempotents form the same biordered set as in S.
- To every regular semigroup S with idempotents E associate the free-est regular semigroup $\mathsf{RIG}(E)$ in whose idempotents form the same biordered set as in S.

Free IG semigroups: formal definitions

Let E be the biordered set of idempotents of a semigroup S.

$$\mathrm{IG}(E) := \langle E \mid e \cdot f = ef \text{ where } \{e, f\} \text{ is a basic pair} \rangle.$$

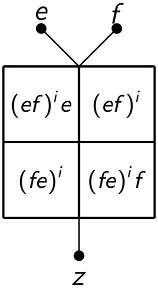
Suppose now S is regular. We define the sandwich sets:

$$S(e, f) = \{h \in E \ : \ ehf = ef, \ fhe = h\} \neq \varnothing$$

$$\mathrm{RIG}(E) := \langle E \mid \mathrm{IG}, \ ehf = ef \ (e, f \in E, \ h \in S(e, f))\rangle.$$

Example 1: V-semilattice

Let $S =$ 
$\mathrm{IG}(S) = \langle e, f, z \mid e^2 = e,\ f^2 = f,\ z^2 = z,\ ez = ze = fz = zf = z \rangle$:



$RIG(S) = \langle e, f, z \mid \mathrm{IG},\ ef = fe = z \rangle = S.$

Example 2: 2×2 rectangular band

$S = \langle e_{ij} \mid e_{ij}e_{kl} = e_{il} \ (i,j,k,l \in \{1,2\}) \rangle$:

e_{11}	e_{12}
e_{21}	e_{22}

$\mathrm{IG}(S) = \langle e_{ij} \mid e_{ij}e_{kl} = e_{il} \ (i,j,k,l \in \{1,2\}, \ i = k \text{ or } j = l) \rangle$:

$(e_{11}e_{22})^i e_{11}$ $(e_{12}e_{21})^i$	$(e_{12}e_{21})^i e_{12}$ $(e_{11}e_{22})^i$
$(e_{21}e_{12})^i e_{21}$ $(e_{22}e_{11})^i$	$(e_{22}e_{11})^i e_{22}$ $(e_{21}e_{12})^i$

$\mathrm{RIG}(S) = \mathrm{IG}(S)$.

Relationships between $S = \langle E \rangle$, $\mathrm{IG}(E)$, and $\mathrm{RIG}(E)$

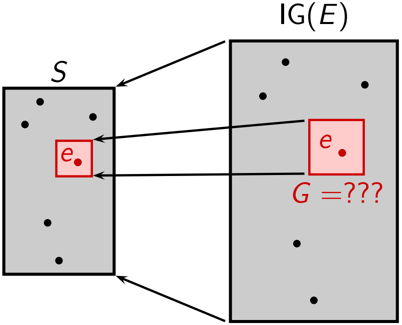
- (Easdown, 1985) There exists a surjective homomorphism $\phi : \mathrm{IG}(E) \to S$ such that
  - the restriction of ϕ to E is an isomorphism of biordered sets;
  - the maximal subgroup H_e in S is the ϕ-image of its counterpart in $\mathrm{IG}(E)$ (which is in turn isomorphic to its counterpart in $\mathrm{RIG}(E)$).
- The 'eggbox picture' of the $\mathcal{D}$-class of e has the same dimensions in all three.
- $\mathrm{IG}(E)$ may contain other, non-regular $\mathcal{D}$-classes.

So, understanding $\mathrm{IG}(E)$ is essential in understanding the structure of arbitrary IG semigroups.

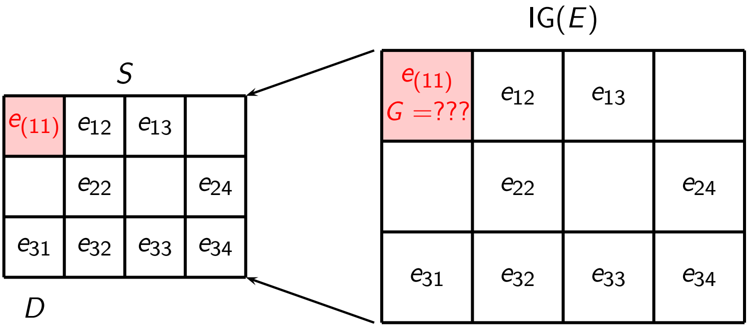
Question

Which groups arise as maximal subgroups of $\mathrm{IG}(E)$ (and thus of $\mathrm{RIG}(E)$)?

The big picture



Let's zoom in



IG(E)
S
$e_{(11)}$
e_{12}
e_{13}
e_{22}
e_{24}
e_{31}
e_{32}
e_{33}
e_{34}
D
$e_{(11)}$
$G = ???$
e_{12}

e_{22}
e_{24}
e_{31}
e_{32}
e_{33}
e_{34}

Presentation for a max. subgroup of $\mathrm{IG}(E)$: Generators

Fact

G is generated by a set in 1-1 correspondence with $D \cap E(S)$.

D

$e_{(11)}$	e_{12}	e_{13}	
	e_{22}		e_{24}
e_{31}	e_{32}	e_{33}	e_{34}

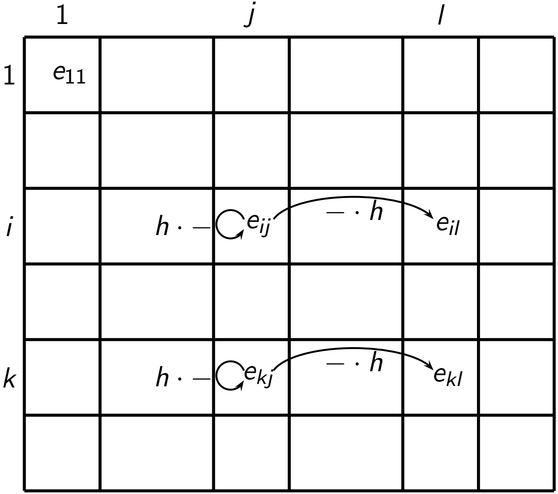
generators of G

f_{11}	f_{12}	f_{13}	
	f_{22}		f_{24}
f_{31}	f_{32}	f_{33}	f_{34}

$$G = \langle f_{ij} \ (e_{ij} \in D \cap E) \mid ??? \rangle$$

Typical relations: $f_{ij}^{-1} f_{il} = f_{kj}^{-1} f_{kl}$

- $h = h^2$



Singular square $\begin{bmatrix} e_{ij} & e_{il} \\ e_{kj} & e_{kl} \end{bmatrix} \Rightarrow$ relation $f_{ij}^{-1} f_{il} = f_{kj}^{-1} f_{kl}$.

Presentation – Approach #1

Theorem (Nambooripad 1979; Gray, Ruškuc 2012)
The maximal subgroup G of $e \in E$ in $IG(E)$ or $RIG(E)$ is defined by the presentation:

$$\begin{aligned}
\langle f_{ij} \mid f_{i,\pi(i)} &= 1 && (i \in I), \\
f_{ij} &= f_{il} && (\text{if } r_j e_{il} = r_l \text{ is a Schreier rep.}), \\
f_{ij}^{-1} f_{il} &= f_{kj}^{-1} f_{kl} && \left(\begin{bmatrix} e_{ij} & e_{il} \\ e_{kj} & e_{kl} \end{bmatrix} \text{ sing. sq.} \right) \rangle.
\end{aligned}$$

Proof: Reidemeister–Schreier rewriting process followed by Tietze transformations.

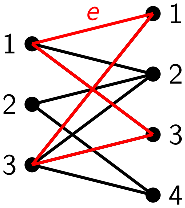
Graham-Houghton complex

Let S be an idempotent generated regular semigroup.

$GH(S)$: a 2-complex whose connected components are in a 1-1 correspondence with $\mathcal{D}$-classes of S.

D

$e_{(11)}$	e_{12}	e_{13}	
	e_{22}		e_{24}
e_{31}	e_{32}	e_{33}	e_{34}



Presentation – Approach #2

Theorem (Brittenham, Margolis, Meakin, 2009)

The fundamental group of $GH(S)$ at any point of its connected component C_e containing the edge $e \cong$ the maximal subgroup of $RIG(E(S))$ (and thus of $IG(E(S))$) containing e.

So,...

... let $\mathcal{T}$ be an arbitrary spanning tree of C_e. Then the maximal subgroup G of $e \in E$ in $\mathrm{IG}(E)$ (or $\mathrm{RIG}(E)$) is defined by the presentation:

$$\begin{aligned} \langle f_{ij} \mid f_{ij} = 1 & \qquad ((i,j) \in \mathcal{T}), \\ f_{ij} f_{kj}^{-1} f_{kl} f_{il}^{-1} = 1 & \ ((i,j,k,l) \text{ is a 2-cell}) \rangle. \end{aligned}$$

Obviously, a clever choice of $\mathcal{T}$ may speed up the computation.

Remarks (1)

- Two types of relations:
  - Initial conditions: declaring some generators equal to 1 (or to each other in approach #1);
  - Main relations: one per singular square.
- All relations of length ≤ 4.
- What can be defined by relations $f_{ij}^{-1} f_{il} = f_{kj}^{-1} f_{kl}$?
- $\begin{bmatrix} 1 & b \\ a & c \end{bmatrix} \Rightarrow ab = c$.

Remarks (2)

- But: Every semigroup can be defined by relations of the form $ab = c$.
- Even better: Every finitely presented semigroup can be defined by finitely many relations of the form $ab = c$.
- Some more special squares ...
- $\begin{bmatrix} a & a \\ b & c \end{bmatrix} \Rightarrow b = c.$
- $\begin{bmatrix} 1 & 1 \\ 1 & a \end{bmatrix} \Rightarrow a = 1.$

The freeness conjecture

Question

Which groups arise as maximal subgroups of $\mathrm{IG}(E)$ (and thus of $\mathrm{RIG}(E)$)?

- Work of Pastijn and Nambooripad ('70s and '80s) and McElwee (2002) led to the belief that these maximal subgroups must always be free groups (of a suitable rank).
- This conjecture was proved false by Brittenham, Margolis, and Meakin in 2009 who obtained the groups $\mathbb{Z} \oplus \mathbb{Z}$ (from a particular 73-element semigroup) and $\mathbb{F}^*$ for an arbitrary field $\mathbb{F}$.
- Finally, Gray and Ruškuc (2012) proved that every group arises as a maximal subgroup of some free idempotent generated semigroup (!!!).

Gray & Ruškuc, 2012

Theorem

Every group is a maximal subgroup of some free idempotent generated semigroup (over a regular semigroup).

Theorem

Every finitely presented group is a maximal subgroup of some free idempotent generated semigroup arising from a finite semigroup.

Remark

Maximal subgroups of free idempotent generated semigroups arising from finite semigroups have to be finitely presented by Reidemeister–Schreier.

Remaining Question

Is every finitely presented group a maximal subgroup in some free idempotent generated semigroup over a finite regular semigroup?

Calculating the groups for natural examples of S

Some or all maximal subgroups in $\mathsf{IG}(E(S))$ have been calculated for the following S:

- Full transformation monoids: Gray, Ruškuc (symmetric groups, provided rank $\leq n-2$);
- Partial transformation monoids: ID (symmetric groups again);
- Full matrix monoid over a skew field: Brittenham, Margolis, Meakin (rank $=1$); ID, Gray (rank $< n/3$ – general linear groups);
- Endomorphism monoid of a free G-act: Dolinka, Gould, Yang (wreath products of G by symmetric groups).

Bands

Theorem (ID)

For every left- or right seminormal band B, all maximal subgroups of $IG(B)$ are free. For every variety $\mathbf{V}$ not contained in $\mathbf{LSNB} \cup \mathbf{RSNB}$ there exists $B \in \mathbf{V}$ such that $IG(B)$ contains a non-free maximal subgroup.

Remaining Question

Which groups arise as maximal subgroups of $\mathrm{IG}(B)$, B a (finite) band?

Answer (ID, Ruškuc, 2013): All of them! (Resp. all finitely presented ones.)

New construction (ID & Ruškuc): set-up

Suppose we want to obtain

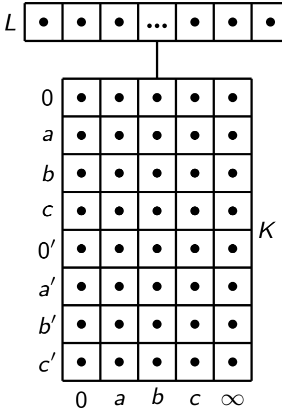
$$G = \langle a, b, c, \dots \mid ab = c, \dots \rangle$$

as a maximal subgroup of $\mathrm{IG}(B)$ for a band B.

- $I = \{0, a, b, c, \dots, 0', a', b', c', \dots\}$;
- $J = \{0, a, b, c, \dots, \infty\}$;
- $\mathcal{T} = \mathcal{T}_I^* \times \mathcal{T}_J$;
- the minimal ideal: $K = \{(\sigma, \tau) \,:\, \sigma, \tau \text{ constants}\}$;
- K is an $I \times J$ rectangular band.

New construction: set-up

- $B = K \cup L$, where L is a left zero semigroup.
- We ensure this by virtue of every $(\sigma, \tau) \in L$ satisfying:
  - $\sigma^2 = \sigma$, $\tau^2 = \tau$;
  - $\ker(\sigma) = \{\{0, a, b, c\}, \{0', a', b', c'\}\}$;
  - thus σ is determined by its image $\{x, y\}$ transversing its kernel;
  - $\mathrm{im}(\tau) = \{0, a, b, c\}$;
  - thus τ is specified by $(\infty)\tau$.



New construction: the action of L on K

Notation	**Indexing**	$\mathrm{im}(\boldsymbol{\sigma})$	$(\boldsymbol{\infty})\boldsymbol{\tau}$
(σ_0, τ_0)	–	$\{0, 0'\}$	0
(σ_a, τ_a)	$a \in A$	$\{0, a'\}$	a
$(\overline{\sigma}_a, \overline{\tau}_a)$	$a \in A$	$\{a, a'\}$	0
$(\sigma_{\mathbf{r}}, \tau_{\mathbf{r}})$	$\mathbf{r} = (ab, c) \in R$	$\{b, c'\}$	a

New construction: the endgame

	0	a	b	c	∞
0	f_{00}	f_{0a}	f_{0b}	f_{0c}	$f_{0\infty}$
a	f_{a0}	f_{aa}	f_{ab}	f_{ac}	$f_{a\infty}$
b	f_{b0}	f_{ba}	f_{bb}	f_{bc}	$f_{b\infty}$
c	f_{c0}	f_{ca}	f_{cb}	f_{cc}	$f_{c\infty}$
$0'$	$f_{0'0}$	$f_{0'a}$	$f_{0'b}$	$f_{0'c}$	$f_{0'\infty}$
a'	$f_{a'0}$	$f_{a'a}$	$f_{a'b}$	$f_{a'c}$	$f_{a'\infty}$
b'	$f_{b'0}$	$f_{b'a}$	$f_{b'b}$	$f_{b'c}$	$f_{b'\infty}$
c'	$f_{c'0}$	$f_{c'a}$	$f_{c'b}$	$f_{c'c}$	$f_{c'\infty}$

$$\xrightarrow{(\sigma_0,\tau_0)\ (\sigma_a,\tau_a)\ (\overline{\sigma}_a,\overline{\tau}_a)}$$

	0	a	b	c	∞
0	1	1	1	1	1
a	1	1	1	1	a
b	1	1	1	1	b
c	1	1	1	1	c
$0'$	1	a	b	c	1
a'	1	a	b	c	a
b'	1	a	b	c	b
c'	1	a	b	c	c

$$(\sigma_{\mathbf{r}},\tau_{\mathbf{r}}) \quad \mathbf{r} : ab = c$$

The word problem
(ongoing joint work with R.D.Gray and N.Ruškuc)

Let S be a semigroup with a finite biordered set $E = E(S)$.

Theorem

There exists an algorithm deciding whether $w \in E^+$ represents a regular element of $IG(E)$.

Key tool: generalised sandwich sets.

Theorem

If every maximal subgroup of $IG(E)$ has a solvable word problem, then there is an algorithm which, given $u, v \in E^+$ such that u represents a regular element, decides whether $u = v$ holds in $IG(E)$.

Corollary

The word problem for $RIG(E)$ is solvable iff the word problem for each of its maximal subgroups is solvable.

The word problem(?)

So, the following question naturally arises:

Question

Is it true that the word problem for $\mathrm{IG}(E)$ (where $E = E(S)$ is finite) is solvable iff the word problem for each of its maximal subgroups is solvable?

ID + RG + NR (2013/14): NO!

Theorem

There exists a finite band B such that all the maximal subgroups of $IG(E(B))$ are free, but the word problem of $IG(E(B))$ is still undecidable.

The band $B_{G,H}$

Let G be a finitely presented group and H its finitely generated group. The band $B_{G,H}$ has 5 $\mathcal{D}$-classes, forming 3 'floors', from top to bottom:

- a left zero band L,
- an 'intermediate' rectangular band K_1,
- a 0-direct union of two copies K', K'' of the rectangular band K from the ID-NR construction,
- the action of L on K' and K'' is exactly the same as in the ID-NR construction.

The band $B_{G,H}$

Properties of $B_{G,H}$:

- any maximal subgroup of $\mathsf{IG}(E(B_{G,H}))$ is either trivial, or isomorphic to G,
- as known from the properties of $\mathsf{IG}(E)$, to the rectangular bands K' and K'' correspond two $\mathcal{D}$-classes M' and M'' of $\mathsf{IG}(E)$ which are completely simple subsemigroups, with typical elements

$$(i', g_1, j') \quad \text{and} \quad (i'', g_2, j''),$$

  $g_1, g_2 \in G$.

Proposition

$(1', 1, 1')(1'', 1, 1'') = (1', 1, 1')(1'', g, 1'')$ *if and only if* $g \in H$.

The Mikhailova construction

Hence, it suffices to take G with a solvable word problem and its finitely generated subgroup H with and undecidable membership problem!

If $G = F_2 \times F_2$ and W is a f.p. 2-generated group with an undecidable problem, then taking H to be the fibre product w.r.t. the natural homomorphism $\pi : F_2 \to W$ (i.e. $H = \ker \pi$) suffices.

Open Problem

Is it at least true that the word problem for $\mathrm{IG}(E)$ is solvable when E is the biorder of a finite normal band?

THANK YOU!
