Introduction

The purpose of this note is to prove a technical result concerning a variation on conditioning which needs be referenced in some other papers. We shall assume familiarity with the context and notation of Pure Inductive Logic as given for example in [1], [2].

The Main Result

Let w be a probability function on SL satisfying Ex. For $\eta(a_1, a_2, \ldots, a_n) \in SL$ with $w(\eta) > 0$ we define $w_{*\eta} : SL \to [0, 1]$ by

$$w_{*\eta}(\theta(a_1, a_2, \ldots, a_m)) = w(\theta(a_{n+1}, a_{n+2}, \ldots, a_{n+m}) \,|\, \eta(a_1, a_2, \ldots, a_n)).$$

Theorem 1. *$w_{*\eta}$ is a probability function on SL.*

Proof. To be a probability function we need to show that $w_{*\eta}$ satisfies the defining conditions:

(P1) If $\vDash \theta$ then $w_{*\eta}(\theta) = 1$

(P2) If $\models \neg(\theta \wedge \phi)$ then $w_{*\eta}(\theta \vee \phi) = w_{*\eta}(\theta) + w_{*\eta}(\phi)$

(P3) $w_{*\eta}(\exists x\, \psi(x)) = \lim_{r\to\infty} w_{*\eta}(\bigvee_{i=1}^{r} \psi(a_i))$

It is clear that $w_{*\eta}$ satisfies (P1-2) so we only have to show it satisfies (P3). In terms of w then this requires

$$\lim_{r\to\infty} w\left(\bigvee_{i=1}^{r} \psi(a_{n+1}, a_{n+2}, \ldots, a_{n+m}, a_{n+i}) \wedge \eta(a_1, \ldots, a_n)\right)$$
$$= w(\exists x\, \psi(a_{n+1}, a_{n+2}, \ldots, a_{n+m}, x) \wedge \eta(a_1, \ldots, a_n)). \quad (1)$$

Noticing that the right hand side of (1) equals

$$\lim_{r\to\infty} w\left(\bigvee_{i=1}^{r} \psi(a_{n+1}, a_{n+2}, \ldots, a_{n+m}, a_i) \wedge \eta(a_1, \ldots, a_n)\right)$$

if (1) was to fail there would have to be some $\beta > 0$ such that for all r,

$$w\left(\bigvee_{i=1}^{r} \psi(a_{n+1}, a_{n+2}, \ldots, a_{n+m}, a_i) \wedge \eta(a_1, \ldots, a_n)\right)$$
$$-w\left(\bigvee_{i=n+1}^{r} \psi(a_{n+1}, a_{n+2}, \ldots, a_{n+m}, a_i) \wedge \eta(a_1, \ldots, a_n)\right) \geq \beta.$$

Equivalently

$$w\left(\bigvee_{i=1}^{n} \psi(a_{n+1}, \ldots, a_{n+m}, a_i) \wedge \neg\left(\bigvee_{i=n+1}^{r} \psi(a_{n+1}, \ldots, a_{n+m}, a_i)\right) \wedge \eta(a_1, \ldots, a_n)\right) \geq \beta. \quad (2)$$

So certainly we must also have

$$w\left(\bigvee_{i=1}^{n} \psi(a_{n+1}, \ldots, a_{n+m}, a_i) \wedge \neg\left(\bigvee_{i=n+1}^{r} \psi(a_{n+1}, \ldots, a_{n+m}, a_i)\right)\right) \geq \beta. \quad (3)$$

Purely to simplify matters suppose that $m = 1$ here, so (3) becomes

$$w\left(\bigvee_{i=1}^{n} \psi(a_{n+1}, a_i) \wedge \neg\left(\bigvee_{i=n+1}^{r} \psi(a_{n+1}, a_i)\right)\right) \geq \beta. \quad (4)$$

Now take $r = 1 + (k+1)n$. Then by Ex for w with $0 \leq s < k$, interchanging the block $a_1, a_2, \ldots, a_n$ with $a_{n+1+ns+1}, a_{n+1+ns+1}, \ldots, a_{n+1+n(s+1)}$ in (4) gives that

$$w\left(\bigvee_{i=n+1+ns+1}^{n+1+n(s+1)} \psi(a_{n+1}, a_i) \quad \wedge \right.$$
$$\left. \neg \left(\bigvee_{i=1}^{n} \psi(a_{n+1}, a_i) \vee \bigvee_{i=n+1}^{n+1+ns} \psi(a_{n+1}, a_i) \vee \bigvee_{i=n+2+n(s+1)}^{r} \psi(a_{n+1}, a_i) \right) \right) \tag{5}$$

is also at least β. But the sentences in (5) as we vary s are disjoint and there are k of them so making $k > \beta^{-1}$ gives a contradiction, as required.
